

Watercone

Easy and cheap solution to generate drinking water for anyone. An independent and mobile device. Suitable for converting any kind of raw water: sea water, brackish or contaminated water. It produces daily up to 1.5 liter during a lifetime of 5 to 7 years.

Reasons for global distribution of the Watercone

- Much cheaper than bottled water
- Absolutely low concept and low tech
- Quick availability in emergency cases
- Perfect for coastal dwellers and remote settlers without access to safe drinking water

1 Pour the salty / brackish water in pan. Then float the Watercone on top. The black pan absorbs the sunlight and heats up the water to support evaporation.

2 The evaporated water condenses as droplets on the inner wall of the cone. The accumulated droplets trickle down the inner wall into a circular trough at the inner base of the cone.

3 By unscrewing the cap at the tip of the cone and turning the cone upside down, one can empty the potable gathered water directly into glass or bottle.
